

EPIPREMNUM CARE GUIDE

LIGHT

Give climbing Epipremnum bright, indirect light. This guide suits pinnatum, including 'Cebu Blue', 'Baltic Blue' and variegated forms, plus amplissimum. They tolerate medium light but grow more slowly. Avoid harsh afternoon sun and provide good filtered light for pale or variegated foliage.

WATERING

Let the top 1-2 inches of mix dry before watering thoroughly. Check below the surface in deep pots, which can stay wet longer. Drain completely and empty the saucer or decorative outer pot. Water less frequently when winter light and growth are reduced.

SOIL

Choose a loose, freely draining houseplant mix in a pot with drainage holes. Repot when roots fill the container, moving up only slightly. Give climbing stems a sturdy pole or trellis, or let them trail from a hanging basket. Attach stems loosely without constricting growth.

TEMPERATURE

Keep in a warm indoor room, roughly 65-85 degrees F, protected from cold drafts, cold glass and direct heating vents. Average to above-average humidity is helpful. Give the plant a steady location and introduce brighter light gradually when moving it.

FERTILIZING

Feed lightly during active spring and summer growth with a balanced houseplant fertilizer at its label rate. A few applications may be enough for slow-growing plants. Reduce feeding in low light. Support and good light encourage larger leaves; mature leaf shape varies by plant.

PESTS

Inspect leaf undersides and stems for pests, and separate affected plants before treatment. Gently wipe dusty foliage. Yellow leaves with persistently wet mix call for a drainage and root check. Keep away from chewing pets and children and avoid contact with irritating sap.
