

For the joy of gardening!

Estabrook's

BURRO'S TAIL

LIGHT

Give *Sedum morganianum* very bright light with gentle direct sun after acclimation. A bright window suits indoor plants. Introduce summer outdoor sun gradually to avoid scorching the succulent leaves.

WATER

Water thoroughly, then let the mix dry before watering again. Drain the pot completely and empty the saucer. Reduce frequency in winter as light and growth decline; avoid repeated small sips.

SOIL & PLANTING

Use a well-drained succulent mix and a container with drainage holes. A stable hanging pot or high shelf displays the trailing stems. Keep the stem bases at their previous level when repotting.

FEEDING

Feed lightly once or twice during active growth using a labeled succulent fertilizer. Avoid heavy feeding. Slow growth in winter is a reason to reduce water and feeding, not to increase either.

SEASONAL CARE

Keep frost-free indoors through Maine winters. Inspect before bringing summer plants inside. Repot infrequently and handle gently because leaves detach easily. Remove dead material without pulling on healthy trailing stems.

HELPFUL TIPS

Place where people and pets will not brush past the hanging stems. Detached healthy leaves can root, but a bare damaged stem will not instantly refill. This tender houseplant has different winter care from the hardy garden sedums sold for outdoor borders.
