

WAXED AMARYLLIS CARE GUIDE

LIGHT

Place a wax-coated amaryllis bulb in bright, indirect light. Turn it every few days to keep flower stems growing upright. Keep the display stable as the stalks become tall and flowers open.

WATERING

Do not water a waxed bulb. It uses stored moisture and food reserves to produce flowers without a pot. Keep the wax dry and do not submerge the bulb or stand it in water.

SOIL

No soil is needed for the waxed display. Use the supplied stand if present and keep the bulb upright. These instructions apply only to intact wax-coated bulbs; bare and potted amaryllis need different care.

TEMPERATURE

Keep indoors at comfortable room temperature, protected from frost and direct heat. Flowering begins within several weeks, but timing varies. Choose bulbs with emerging stalks rather than finished flowers.

FERTILIZING

Do not fertilize during the waxed display. The bulb supports flowering from its reserves. Remove each finished flower stalk after its last bloom fades. These bulbs are normally sold for one season of enjoyment.

AFTER FLOWERING

Discard the spent bulb, or remove wax and decorations before composting it. Recovery for future bloom is uncertain. If you want to try saving a healthy bulb, ask us about removing the wax and starting ordinary potted-amaryllis care.
